USING THE TUFF-TIE[®] BLOCK

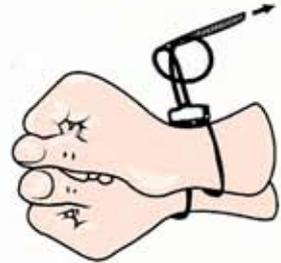

1. Place one thumb inside the loop of the pig tail to hold it stable.

2. Slip your other thumb OVER the locking block and slide the block DOWN while the first thumb holds the pig tail stable.

3. Slide the block down until it is snug to the prisoners wrists.

4. After snugging, as an added locking feature, make a simple overhand knot as close to the block as possible with the excess tail of the braid.

Slide the block down with **AUTHORITY**. Don't be afraid to use some force in sliding the block **SNUG** to the wrist. As you slide the block down, you will feel some **SLIGHT** resistance. This is proper and is due to the close tolerances necessary for the teeth to "read" the braid. The teeth find the depressions in the braid and lock themselves in. From that point on, the harder that the prisoner tries to break free, the tighter he locks the teeth in place. In fact, in most instances, you will notice a back ratcheting of the braid for approximately 1/16" as the teeth read. Not to worry, it is part of the design. We designed them so that there is a "reasonable margin" of forgiveness. Therefore, it is almost impossible to cut off circulation at the wrists.
